

Card Game Debriefing

You just completed a developmental psychology experiment. We are studying how people learn about where things are located in space. We are having both kids and adults participate in this experiment, so we can see whether they learn about space differently.

We first asked you to learn about a world of cards. Then after you played a number game, you learned about some new cards. Some people were asked to learn new cards that were part of the same world as before. Other people [- like you! -] learned new cards from a completely different world. We are interested in how kids and adults learn new information that is either related (in the same world) or unrelated (in a different world) to what they have learned before. We think that adults might learn best when new cards are related, while kids may learn best when the new cards are unrelated.
